1. Functional description

VB604s is a multifunctional transmitter for top-hat rail assembly with the following main characteristics:

- Measurement of DC voltage, DC current, temperature (RTD, TC) and resistance
- Programmable remote I/O functionality. Readout of all input variables and internally calculated values via MODBUS. Simultaneously, the outputs and the relay may be controlled via MODBUS.
- Free selection as to whether the output variables are dependent on the input variables or whether the outputs are controlled independently of the inputs via MODBUS.
- Sensor connection without any external jumpers
- 2 inputs (e.g. for sensor redundancy or difference formation)
- 2 outputs (U and/or I)
- 2 inputs can be linked with each other and allocated to the 2 outputs which enables calculations and sensor monitoring (e.g. prognostic maintenance of sensors)
- System capability: Communication via Modbus interface
- Freely programmable relay, e.g. for limit or alarm signalling
- AC/DC wide-range power supply unit
- Pluggable high-quality screw terminals

All settings of the instrument can be adapted to the measuring task by PC software. The software also serves visualising, commissioning and service.

A distinctive feature of SINEAX VB604s is constituted by the fact that, apart from the full functional range of a multifunctional signal converter, it can also be used as a small remote I/O system.

In SINEAX VB 604s, the signal flow may be controlled in such a way that the input signal or the measured variable is not inevitably routed to the output. However, the values can be communicated via MODBUS.

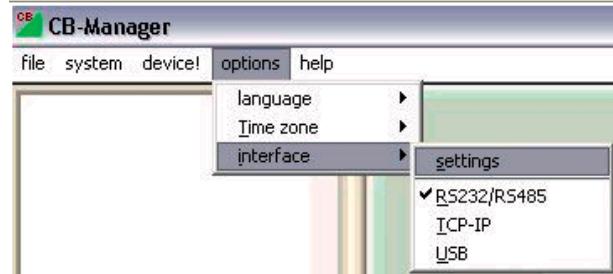

In this operating mode, the outputs as well as the relay may also be controlled via MODBUS.

Whether this remote functionality is applicable to both or only to one channel can be freely selected. If only one channel is selected, the second one behaves like a normal signal converter.

2. Connection of SINEAX VB604s to a PC and communication via CB-Manager.

VB604s communicates with a PC (CB-Manager) via an RS 232/RS485 interface and a MODBUS protocol.

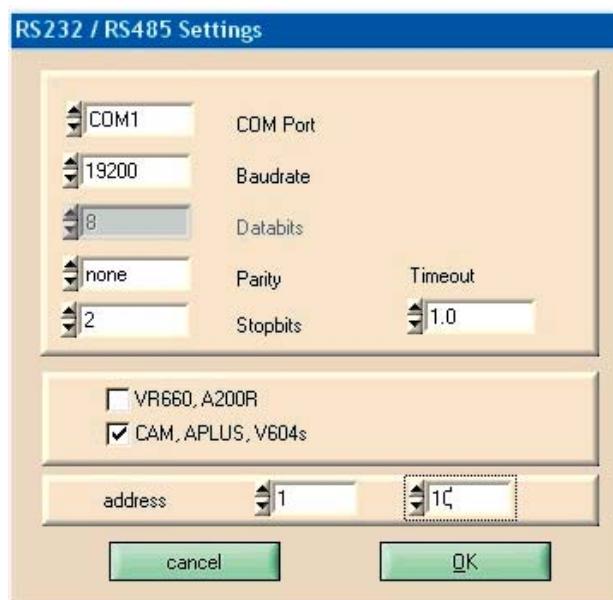

Select the following settings in this respect:

Select the RS 232/ RS485 interface under Options / Interface.

This is also applicable if an RS485/USB converter is used and the converter is connected to the computer via the USB connection.

Subsequently, enter the following settings under Options / Interface / Settings:

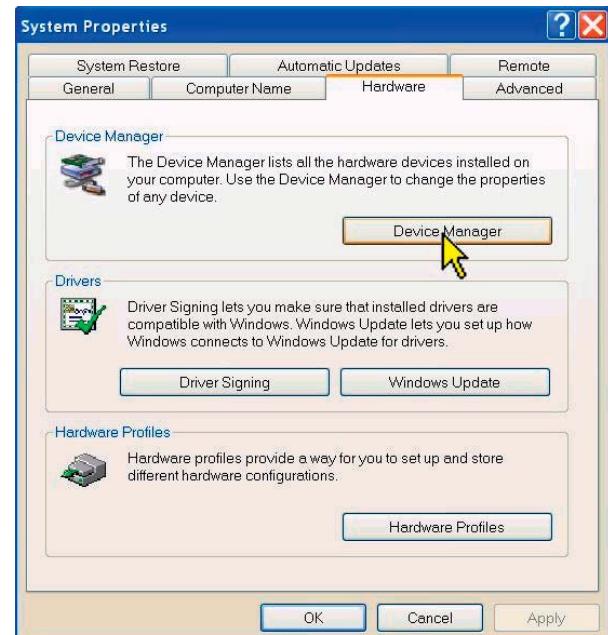

The existing COM ports are determined as the communication interface when starting the program and selecting RS232/RS485. Only COM ports found are available for selection.

Limiting the range of possible device addresses speeds up the search of connected devices considerably.

Example: If only 2 devices are connected, it makes sense to select the address range from 1 to 2.

All settings are stored as the program is terminated. If the COM port is not available upon the next start of the program (e.g. because the converter has not been plugged in) another valid interface is set.

To determine which COM port has been allocated to the RS485 converter (if required), please proceed as follows:

The COM port of an external RS232 or RS485 converter may be determined (and, if required, changed) via the Windows system control.

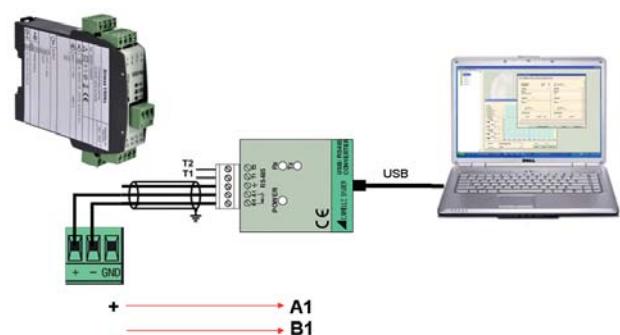

Example for Windows XP: **System control => System**

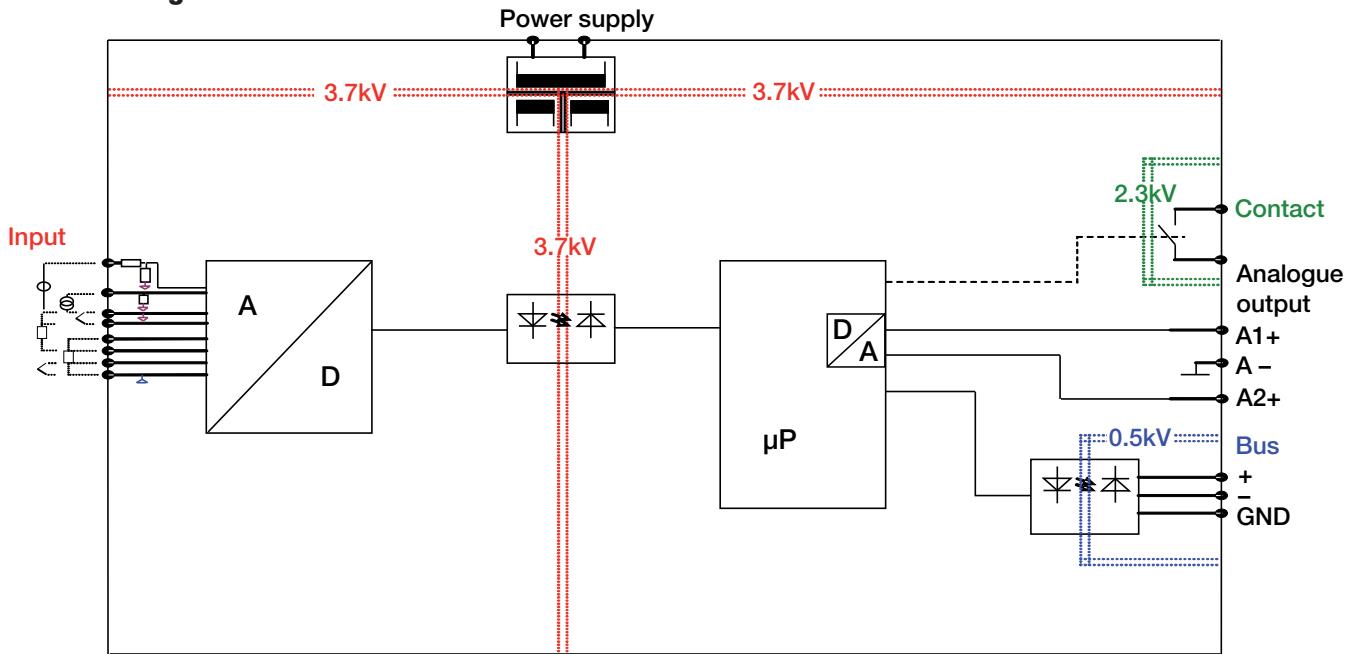

This example shows the COM ports of a PCMCIA card and a USB-RS232 converter:

- Silicom Serial Card: COM1
- USB-RS232 adapter: COM4

If you use the Camille Bauer USB-RS485 converter (Article Number 163189), the same is to be connected as follows:

3. Block diagram

4. Technical data

Table 1: Input variables, measuring ranges

Measurement type	Measuring range	Minimum span
DC voltage [mV]	-1000 ... 1000 mV	2 mV
DC voltage [V]	-300 ... 300 V	>1 V
DC current [mA]	-50 ... 50 mA	0,2 mA
Resistance [Ω]	0 ... 5000 Ω	8 Ω
RTD Pt100	-200 ... 850 °C	20 K
RTD Ni100	-60 ... 250 °C	15 K
TC Type B	0 ... 1820 °C	635 K
TC Type E	-270 ... 1000 °C	34 K
TC Type J	-210 ... 1200 °C	39 K
TC Type K	-270 ... 1372 °C	50 K
TC Type L	-200 ... 900 °C	38 K
TC Type N	-270 ... 1300 °C	74 K
TC Type R	-50 ... 1768 °C	259 K
TC Type S	-50 ... 1768 °C	265 K
TC Type T	-270 ... 400 °C	50 K
TC Type U	-200 ... 600 °C	49 K
TC Type W5Re-26Re	0 ... 2315 °C	135 K
TC Type W3Re-25Re	0 ... 2315 °C	161 K

Measuring input 1 →

Direct voltage

Measuring range mV For limits see Table 1
 Ri > 10 MΩ, continuous,
 overload max. ±1200 mV

Direct current

Measuring range mA For limits see Table 1
 Ri = 11 Ω, continuous,
 overload max. ±50 mA

Resistance thermometer RTD

Resistance measurement types Pt100 (IEC 60 751),
 adjustable Pt20...Pt1000
 Ni100 (DIN 43 760),
 adjustable Ni50...Ni1000
 Measuring range limits See Table 1
 Wiring 2, 3 or 4-wire connection
 Measuring current 0.2 mA
 Line resistance 30 Ω per line,
 in 2-wire connection adjustable or
 calibratable

Thermocouples TC

Thermocouples Type B, E, J, K, N, R, S, T
 (IEC 60 584-1)
 Type L, U (DIN 43 760)
 Type W5Re-W26Re, W3Re-
 W25Re (ASTM E988-90)
 Measuring range limits See Table 1
 Cold junction compensation Internal (with installed Pt100),
 with Pt100 on terminals, external
 with reference junction thermostat
 -20...70 °C

Resistance measurement, teletransmitter, potentiometer

Measuring range limits See Table 1
 Wiring 2, 3 or 4-wire connection
 Resistance teletransm. Type WF and WF DIN
 Measuring current 0.2 mA
 Line resistance 30 Ω per line,
 in 2-wire connection adjustable or
 calibratable

Same as Measuring input 1

Resistance measurement, teletransmitter, potentiometer

Same as Measuring input 1 except:

Wiring 2 or 3-wire connection

Please note:

The following device types are available:

a) VB604s with measuring input for 2x direct current [mA]

Measuring inputs 1 and 2 are galvanically connected. If 2 input sensors or input variables are used, observe combination options in Table 3 and circuit instructions p.17!

Analog outputs 1 and 2

The two outputs are galvanically connected and have a common earth. Voltage and current output software-configurable.

Direct current

Output range	± 20 mA, range may be freely set
Burden voltage	max. 12 V
Open circuit voltage	< 20 V
Limit	Adjustable, max. ±22 mA
Residual ripple	<1% pp related to 20 mA

Direct Voltage

Output range	± 10 V, range may be freely set
Load	max. 20 mA
Current limit	Approx. 30 mA
Limit	Adjustable, max. ±11 V
Residual ripple	<1% pp related to 10 V

Output settings

Limit	
Gain/offset trimming	
Inversion	

Relay contact output

Contact	1 pole, normally open contact
Switching capacity	AC: 2 A / 250 V AC DC: 2 A / 30 V

Bus/programming connection

Interface, protocol	RS-485, Modbus RTU
Baudrate	9,6...115,2 kBaud, adjustable

5. Modbus interface

5.1 EIA-RS-485 Standard

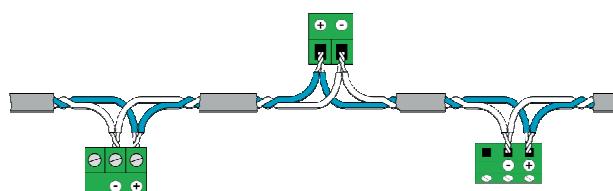

The EIA-RS-485 standard defines the physical layer of the Modbus interface.

Coding

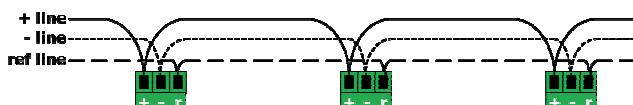

The data is transmitted in serial form via the 2-wire bus. The information is coded as a difference signal in the NRZ code. Positive polarity signals a logic 1, negative polarity signals the logic 0.

Connections

A shielded, twisted, 2-conductor cable should be used as a bus cable. Shielding serves improved electromagnetic compatibility (EMC). Depending on the source of information, the description of Conductor A and B is contradictory.

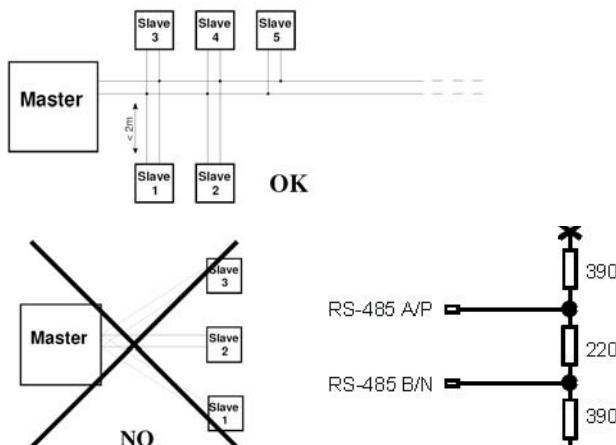

The potential difference of all bus participants may not exceed ± 7V. Therefore, the use of a shield or a third conductor (ref line) is recommended to create potential equalisation.

Topology

Both ends of the bus cable must be equipped with a line terminator. Supplementing the line termination resistance RT of the EIA-RS-485 standard an additional resistance RU (pullup) must be wired against the supply voltage and a resistance RD (pulldown) against the reference potential. These two resistances ensure a defined idle potential on the line when none of the participants is sending.

System requirements

Cable:	Twisted, 2-wire line, wave resistance 100 to 130 Ω, min. 0.22mm² (24AWG)
Line length:	Maximum 1'200m depending on the transmission rate
Participants:	Maximum 32 per segment
Rate:	9'600, 14'400, 19'200, 38'400, 56'000, 57'600, 115'200 Baud
Mode:	11 bit format - 2 stop bit without parity or 1 stop bit with even/uneven parity

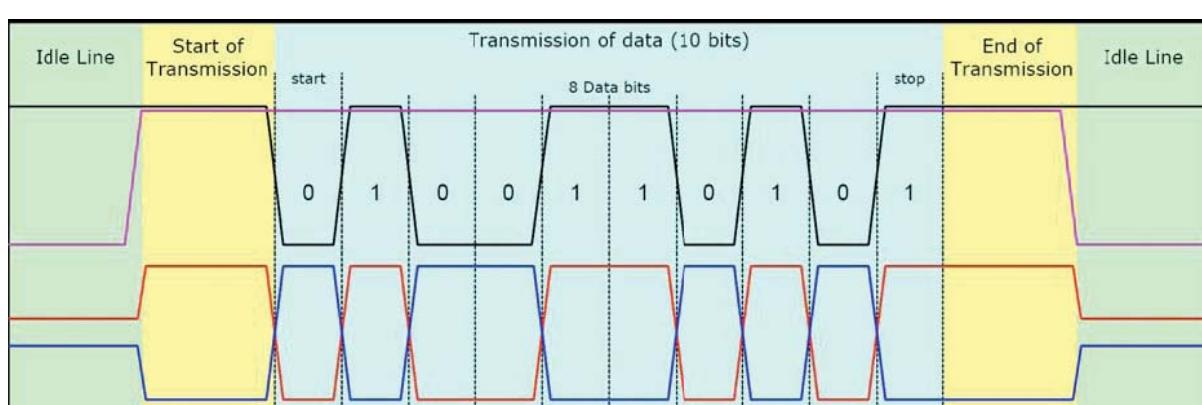

5.2 Coding and addressing

Addressing

In the telegram, all data addresses refer to zero. The first data element is always addressed via the 0 address. For example, the coil which is known as "Coil 1" in the device, is addressed as "Coil 0" in the telegram. Coil 127 is addressed as 0x007E.

Holding register 40001 is addressed as Register 0 in the telegram. The function code of the telegram already states that a "holding register" is concerned. Consequently, the reference to "4XXXX" is implicit.

Holding register 40108 is addressed as 0x006B (107 decimal).

Serialisation

The specification defines the telegrams as byte sequences. The respective physical layer (RS485, Ethernet) is responsible for the correct serialisation of the bytes (MSB or LSB First). RS485 (UART, COM) transmits the "Least Significant Bit" first (LSB First) and adds the synchronisation and backup bits (start bit, parity bit and stop bit).

Start	1	2	3	4	5	6	7	8	Par	Stop
-------	---	---	---	---	---	---	---	---	-----	------

Bits

Bits are represented within a byte in a conventional manner with the MSB (Bit 7) leftmost and the LSB (Bit 0) rightmost ($0101'1010 = 0x5A = 90$). An example for the inquiry of Coils 20 to 40 of Slaves 17.

Byte	Inquiry		Response	
	Slave address	0x11	Slave address	0x11
0	Function code	0x01	Function code	0x01
1	Start address	0x00	Byte count	0x03
2	19 = Coil 20	0x13	Byte 0	0xCD
3	Number	0x00	Byte 1	0x6B
4	20...40 = 21	0x15	Byte 2	0x01

The start address in the inquiry plus the bit position in response byte 0 corresponds to the coil address. Commenced bytes are completed with zeros. Coil 27...20 = 0xCD = 11001101b → Coil20 = ON, Coil21 = OFF, Coil22 = ON, etc.

Bytes

Modbus does not know a byte or character data type (see address space). Strings or byte arrays are mapped in "holding registers" (2 characters per register) and transmitted as a "character stream", e.g. "Hello_World".

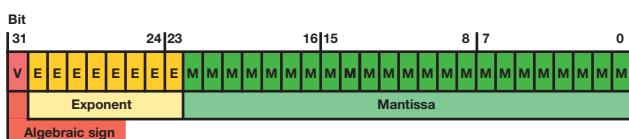

Register	HEX	char	Register	HEX	char
40101	0x4865	,H'	40104	0x576F	,W'
40102	0x6C6C	,I'	40105	0x726C	,r'
40103	0x6F5F	,o'	40106	0x6400	,d'

Words

Registers or words are transmitted according to specification in "Big Endian" format, e.g. Read Holding Register 40101 of Slave 17.

Float

Modbus does not know any data types to represent floating point numbers. On principle, any data structures may be mapped on the 16Bit register ("cast"). The IEEE 754 standard is the most used standard to represent floating point numbers.

The first register contains Bits 15 – 0 of the 32-bit number (bit 0...15 of the mantissa).

The second register contains Bits 16 – 32 of the 32-bit number (algebraic sign, exponent and Bit 16- 22 of the mantissa).

5.3 Mapping

Address space

The address space may be divided into 4 address spaces according to the 4 types of data.

Space	r/w	Address area	Function code	
Coil	Readable Writeable	00001 - 09999	0x01	Read Coil Status ¹⁾
Discrete input	Only readable	10001 - 19999	0x05	Force Single Coil ¹⁾
Input register	Only readable	30001 - 39999	0x0F	Force Multiple Coils ¹⁾
Holding register	Readable Writeable	40001 - 49999	0x03	Read Holding Registers
			0x06	Force Single Register ¹⁾
			0x10	Preset Multiple Registers

¹⁾ not implemented

To reduce the commands, the device image was represented as far as possible in "holding registers".

Segments

Address	Description	Permitted function codes	
40209 - 40210	Actions		
40257 - 40284	Measured values, status	0x03	Read Holding Registers
40515 - 40516	Settings (Modbus)	0x10	Preset Multiple Registers
40517 - 40761	Configuration data		
41076	Device type	0x03	Read Holding Registers

Syntax

Address	Start address of the described data block (register, coil or input status)
Description	Unique variable or structure description
Data type	Data type of variable (U: unsigned, INT: integer, 8/16/32 bit, REAL or CHAR[.])
#	Offset from the start address in the data type unit, for Byte 0: Low, 1: High byte
Default	Value upon delivery or after a hardware reset
Description	Exact details concerning the variable described

5.4 Device identification

The device is identified by "Read Slave ID".

Function 11h: Report Slave ID

Master telegram:

Device address	Function	CRC	
ADDR	0x11	LO	HI

Slave telegram:

Device Address	Function	Number data bytes	Slave ID	Sub ID	Data 2	CRC

			3-15 Reserved

5.5 Signal flow

The following diagram shows the VB604s signal flow. All relevant measured variables and parameters determining the signal flow are represented.

5.6 Measured values

Triggering action

Address	Description	Data type	#	Default	Description						
40209	ACTION	UINT16		0	<p>This register starts actions.</p> <table> <thead> <tr> <th>Action</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>18</td> <td>Input 1: With short-circuited input terminals, the line calibration is realised and the measured parameters are stored in the device. This procedure is indicated by a flashing green LED.</td> </tr> <tr> <td>19</td> <td>Line calibration at Input 2 (same as Input 1)</td> </tr> </tbody> </table>	Action	Description	18	Input 1: With short-circuited input terminals, the line calibration is realised and the measured parameters are stored in the device. This procedure is indicated by a flashing green LED.	19	Line calibration at Input 2 (same as Input 1)
Action	Description										
18	Input 1: With short-circuited input terminals, the line calibration is realised and the measured parameters are stored in the device. This procedure is indicated by a flashing green LED.										
19	Line calibration at Input 2 (same as Input 1)										
40210	ACTDAT				Additional information for the implementation of an action.						

Simulation of output variables

- Writing into the PERCENT1, PERCENT2, OUTPUT1, OUTPUT2 registers interrupts the signal flow to the respective variable and the desired value is specified (However, percent and output value cannot be simulated simultaneously). The status of the simulation mode can be read in the STATUS2 status register.
- The simulation mode is terminated by writing 0 into the respective bits in the STATUS2 register.
- VB604s:
 - After a change of the configuration parameters, the desired value must be specified again.
 - A relay parameter can be specified by writing into the RELAISSIM register (only if ALARMSET for relay = 00h).

Resetting of communication settings

Once the MODBUS settings have been stored in the device, communication with the device is only possible if the settings are known.

The following technique resets the MODBUS settings to the delivery status:

- Device address: 01h
- Baudrate: 19200
- Parity: None
- Stop bits: 2

A plug prepared for this purpose (Terminal + is connected to Terminal GND with a resistance of 1 kOhm) is connected to the RS485 interface before the device is switched on.

After the device has been switched on, the red LED shines for approx. 30 seconds. During this time, the green LED flashes. Subsequently, the red LED turns off (the green LED continues flashing). Within further 30 seconds, this plug has to be removed from the device.

After the successful completion of this procedure, the communication default settings are stored again in the device.

If the procedure described is not adhered to, the interface parameters are not changed.

¹ Max. +/-22 mA or +/-11 V

² Automatic correction of parameters in the device.

Each parameter must range within permitted limits. These partly depend on other parameters.

If parameters determining the limits of dependent parameters are changed,

(e.g. measuring range is dependent on the type of measurement), the respective parameters are automatically limited to the permitted parameters. The status will show that such a correction has taken place.

Limitations of configuration parameters

Options to combine types of measurement

Register: 40523, 40534

The numerous types of measurement can be combined with each other in different ways.

See Table 3 p.18

The "earthed" combination is used if both sensors are connected to each other.

Measuring ranges

Register: 40524, 40535

see table 1 / page 3

Due to linking and scaling, the measuring ranges are rescaled to different ranges.

This is automatically realised in the device.

Abbreviations:

k_1 : SCALE1

k_2 : SCALE2

$T_{1a} \dots T_{1e}$ INPRANGE1 $Min1 = T_{1a} * k_1$ $Max1 = T_{1e} * k_1$

$T_{2a} \dots T_{2e}$ INPRANGE2 $Min2 = T_{2a} * k_2$ $Max2 = T_{2e} * k_2$

Matrix	Minimum value MEAS1	Maximum value MEAS1
Input 1	Min1	Max1
Input 2	Min2	Max2
Input 1 + 2	Min1 + Min2	Max1 + Max2
Input 1 - 2	Min1 - Max2	Max1 - Min2
Input 2 - 1	Min2 - Max1	Max2 - Min1

Matrix		Minimum value MEAS1	Maximum value MEAS1
Input 1 * 2			
Input 1	Input 2		
Min1	Max1	Min2	Max2
≥ 0	> 0	≥ 0	> 0
< 0	≤ 0	≥ 0	> 0
< 0	> 0	≥ 0	> 0
≥ 0	> 0	< 0	≤ 0
< 0	≤ 0	< 0	≤ 0
> 0	> 0	< 0	≤ 0
≥ 0	> 0	< 0	> 0
< 0	≤ 0	< 0	> 0
< 0	> 0	< 0	> 0
Min (Min1 * Max2, Min2 * Max1)			
Minimum value (Input 1, 2)	Min (Min1, Min2)	Min (Max1, Max2)	
Maximum value (Input 1, 2)	Max (Min1, Min2)	Max (Max1, Max2)	
Mean value (Input 1, 2)	(Min1 + Min2)/2	(Max1 + Max2)/2	
Sensor backup Input 1	Min1 ¹	Max1 ¹	
Sensor backup Input 2	Min2 ¹	Max2 ¹	
Sensor backup minimum value (Input 1, 2)	Min1 ¹	Max2 ¹	
Sensor backup maximum value (Input 1, 2)	Min1 ¹	Max2 ¹	
Sensor backup mean value (Input 1, 2)	Min1 ¹	Max2 ¹	

¹ $k_1 = k_2$, $T_{1a} = T_{2a}$, $T_{1e} = T_{2e}$

Setting time

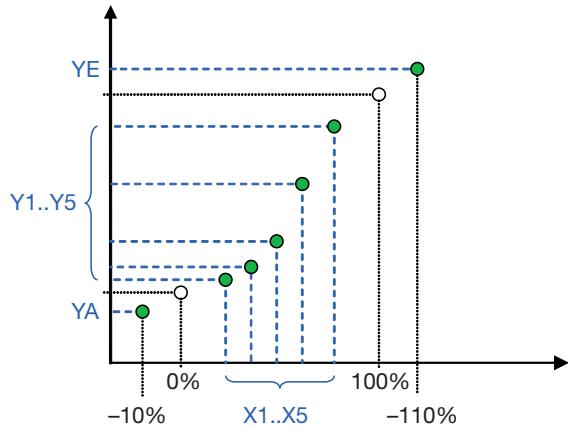

Register: 40547

The minimum setting time depends on whether both inputs are configured, on the types of measurement, on breakage and short circuit monitoring.

The following minimum setting times result for the input:

Type of measurement	Minimum setting time [ms]	Breakage monitoring	Short circuit monitoring
Voltage [mV]	315	X	-
Voltage [V]	160	-	-
Current [mA]	160	-	-
Resistance [Ω] 2L	280	X	X
Resistance [Ω] 3L, WF, WF_DIN	595	X	X
Resistance [Ω] 4L	435	X	X
Thermocouple int. comp.	475	X	-

Linearisation tables

The transmission functions stored in registers OUTSET1 or OUTSET2 constitute information for the PC software to generate the desired transmission function with the table values. This information is irrelevant for the device.

Characteristic curves:

- User-defined, linear, quadratic
 - Volume of a horizontal cylinder:
- $$y = \frac{1}{\pi} \cdot \left[\arccos(1 - 2x) - 2 \cdot \sqrt{x - x^2} \cdot (1 - 2x) \right] \quad (h/2r = x = 0..1, \quad y = 0..1)$$

6. Electric connections

Circuit	Terminals	Remarks
Measuring input	1 to 8	See Table 1, page 3
Output 1 Output 2	11 (+), 12 (-) 10 (+), 12 (-)	
Relay contact	9, 13	
Power supply	15 (+/-) 16 (-/-)	
Bus-/programming connection	+, -, GND	Front plug

Wiring with 2 input sensors

If 2 input sensors or input variables are used, observe combination options in Table 3!

If 2 input sensors or input variables are used, these must be free of potential or galvanically isolated against each other, on principle! Otherwise, the transmitter may be damaged. Exceptions:

- In case of a permitted input combination¹ with common (and approved) connections on Terminal 4. E.g. direct voltage mV (Terminal 3, 4) & direct voltage V (Terminal 6, 4)
- In case of a permitted input combination¹ with the same reference potential (e.g. earth) on Terminal 4 and 8. E.g. 2 thermocouples (on Terminals 3, 4 or 7, 8) with earthed sensor tips or two mV inputs with a common earth potential on Terminals 4 and 8. In these cases, the specified types of measurement must be configured for earthed sensors.

¹ See Table 3 "Options to combine types of measurement" page 18

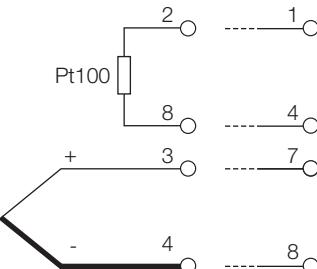

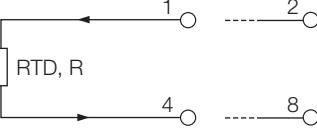

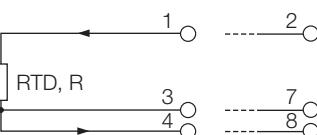

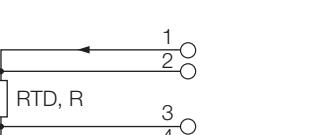

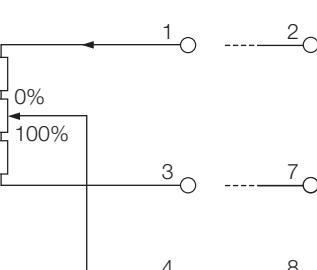

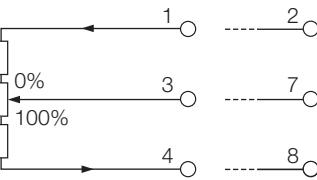

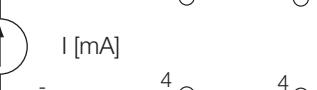

Types of measurement	Wiring	
	Input 1	Input 2
Thermocouple with Pt100 at the terminals at the other input		
Resistance thermometer or resistance measurement 2-wire		
Resistance thermometer or resistance measurement 3-wire		
Resistance thermometer or resistance measurement 4-wire		
Resistance teletransmitter WF		
Resistance Teletransmitter WF-DIN		
Direct voltage mA (Input 2 only in corresponding device type)		

Table 2: Connections of inputs

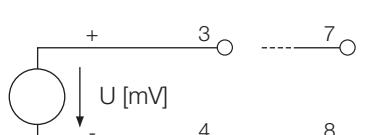

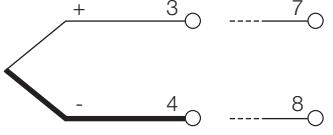

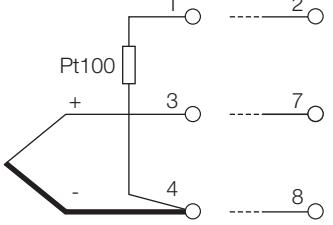

Types of measurement	Wiring	
	Input 1	Input 2
Direct voltage mV		
Thermocouple with external cold junction thermostat or internally compensated		
Thermocouple with Pt100 at the terminals at the same input
